Architecture

1. A figure detailing the architecture: This figure should show the components you are using to build your solution: Storage service (DB, object storage, etc.), AI service, a specific software program/application, etc. The figure must also show the workflow of these components (pipeline): inputs and outputs of each component: how these components are “connected”
2. For each component: two lines of text (maximum) explaining the component.

Deployment

For each component, detail which Cloud services/model to use for its deployment:

Examples (These are just examples. It’s up to you to specify your components):

1. The DB are deployed on AWS RDS
2. The data are stored on S3
3. The application/program is deployed on a K8s cluster. It is composed of xx containers. Container 1 is …. Container 2 is …, etc.
4. The application/program is deployed on a VM
5. The application is represented by a FaaS or a set FaaS. Here is the list of FaaS …
6. A load balancer is used to …

Tasks

List the set of tasks you (all the group) realised within your project.

Examples (These are just examples. It’s up to you to specify your tasks):

1. A comparative study of cloud services for use in your solution
2. Design of the architecture
3. Deployment and implementation
4. Scalability
5. Deployment cost analysis
6. Security, privacy, sovereignty

For each task, specify the students involved.
